

SCIKIT-LEARN CHEATSHEET: PYTHON MACHINE LEARNING TUTORIAL

In this step-by-step Python machine learning cheatsheet, you'll learn how to use Scikit-Learn to build and tune a supervised learning model!

Scikit-Learn, also known as sklearn, is Python's premier general-purpose machine learning library. While you'll find other packages that do better at certain tasks, Scikit-Learn's versatility makes it the best starting place for most ML problems.

To see the most up-to-date full tutorial, as well as installation instructions, visit the online tutorial at elitedatascience.com.

SETUP

Make sure the following are installed on your computer:

• Python 2.7+ or Python 3

- NumPy
- Pandas
- Scikit-Learn (a.k.a. sklearn)

*We strongly recommend installing Python through Anaconda (installation guide). It comes with all of the above packages already installed.

IMPORT LIBRARIES AND MODULES

import numpy as np

import pandas as pd

from sklearn.model_selection import train_test_split

from sklearn import preprocessing

from sklearn.ensemble import RandomForestRegressor

from sklearn.pipeline import make_pipeline

from sklearn.model_selection import GridSearchCV

from sklearn.metrics import mean_squared_error, r2_score

from sklearn.externals import joblib

LOAD RED WINE DATA

dataset_url = 'http://mlr.cs.umass.edu/ml/machine-learning-databas es/wine-quality/winequality-red.csv'

data = pd.read_csv(dataset_url, sep=';')

SPLIT DATA INTO TRAINING AND TEST SETS

y = data.quality

X = data.drop('quality', axis=1)

X_train, X_test, y_train, y_test = train_test_split(X, y,

test_size=0.2,

random_state=123,

stratify=y)

DECLARE DATA PREPROCESSING

STEPS

pipeline = make_pipeline(preprocessing.StandardScaler(),

RandomForestRegressor(n_estimators=100))

DECLARE HYPERPARAMETERS TO TUNE

hyperparameters = { 'randomforestregressor_max_features' : ['auto', 'sqrt', 'log2'], 'randomforestregressor_max_depth':

[None, 5, 3, 1]}

TUNE MODEL USING CROSS-VALIDATION PIPELINE

clf = GridSearchCV(pipeline, hyperparameters, cv=10)

clf.fit(X_train, y_train)

REFIT ON THE ENTIRE TRAINING SET

No additional code needed if clf.refit == True (default is True)

EVALUATE MODEL PIPELINE ON TEST DATA

pred = clf.predict(X_test)

print r2_score(y_test, pred)

print mean_squared_error(y_test, pred)

SAVE MODEL FOR FUTURE USE

joblib.dump(clf, 'rf_regressor.pkl') # To load: clf2 = joblib.load('rf_regressor.pkl')
